

Pandas - Data Correlations

February 21, 2026

0.1 I. Finding Relationships

A great aspect of the Pandas module is the `corr()` method. The `corr()` method calculates the relationship between each column in your data set. The examples in this page uses a CSV file called: 'data.csv'.

```
[ ]: import pandas as pd
      df = pd.read_csv('data.csv')
      #print(df.info())
      df.corr()
```

```
[ ]:      Duration      Pulse  Maxpulse  Calories
      Duration  1.000000 -0.155408  0.009403  0.922717
      Pulse    -0.155408  1.000000  0.786535  0.025121
      Maxpulse  0.009403  0.786535  1.000000  0.203813
      Calories  0.922717  0.025121  0.203813  1.000000
```

Note: The `corr()` method ignores “not numeric” columns.

0.2 II. Result Explained

The Result of the `corr()` method is a table with a lot of numbers that represents how well the relationship is between two columns. The number varies from -1 to 1. 1 means that there is a 1 to 1 relationship (a perfect correlation), and for this data set, each time a value went up in the first column, the other one went up as well. 0.9 is also a good relationship, and if you increase one value, the other will probably increase as well. -0.9 would be just as good relationship as 0.9, but if you increase one value, the other will probably go down. 0.2 means NOT a good relationship, meaning that if one value goes up does not mean that the other will.

What is a good correlation? It depends on the use, but I think it is safe to say you have to have at least 0.6 (or -0.6) to call it a good correlation.

0.3 III. Perfect Correlation:

We can see that “Duration” and “Duration” got the number 1.000000, which makes sense, each column always has a perfect relationship with itself.

0.4 IV. Good Correlation:

“Duration” and “Calories” got a 0.922721 correlation, which is a very good correlation, and we can predict that the longer you work out, the more calories you burn, and the other way around: if you

burned a lot of calories, you probably had a long work out.

0.5 V. Bad Correlation:

“Duration” and “Maxpulse” got a 0.009403 correlation, which is a very bad correlation, meaning that we can not predict the max pulse by just looking at the duration of the work out, and vice versa.
