

Simple Text-Based/Command Line Projects

1. **Number Guessing Game:** Create a game where the computer picks a random number, and the user tries to guess it. The program provides hints if the guess is too high or too low.
2. **Password Generator:** A utility that generates a strong, random password based on user-specified criteria like length and the inclusion of numbers, symbols, or letters.
3. **To-Do List Manager:** A command-line application that allows users to add, view, and delete tasks, potentially saving the data to a simple text file.
4. **Currency Converter:** Build a converter that asks for exchange rates and converts between different currencies.
5. **Rock, Paper, Scissors:** A game where the user plays against the computer's random choice.
6. **Tic-Tac-Toe:** Implement the classic 3x3 game, starting with a text-based version and potentially adding a graphical interface (GUI) or an AI opponent later.
7. **Build an alarm clock where users can set a specific time for the alarm to go off.**

Tips for Success

- **Start small:** Begin with the core functionality and add features incrementally.
- **Break down the problem:** Divide the project into smaller, manageable tasks.
- **Use online resources:** Many websites, like [freeCodeCamp](https://www.freecodecamp.org/) and [\[GeeksforGeeks\]\(https://www.geeksforgeeks.org/python/python-projects-beginner-to-advanced/\)](https://www.geeksforgeeks.org/python/python-projects-beginner-to-advanced/), offer tutorials and source code for these projects.
- **Experiment:** Once a project is working, challenge yourself to add new features or improve the user interface.
