1 Visualization Quick Guide

1.1 A best practice guide to help you find the right visualization for your data

A key component of executive management is the dashboard, which displays a collection of key performance indicators (KPIs) as interactive visualizations.

This guide provides a quick reference for determining which visualization type offers the best representation of a given data set.

1.2 INTRODUCTION

Data can often show a number of different relationships. For the development of effective dashboards, it is important to understand which relationship type is being shown, and then identify the best visualization to express that type.

Data relationship types include: - Nominal - Time Series - Ranked - Part-to-whole - Frequency - Correlation

The following pages detail these relationship types, along with the most effective visualizations for each type and best practices for those visualizations.

1.3 NOMINAL RELATIONSHIPS

NOMINAL - Individual values that are comparative but not connected.
