What is Tkinter?

Tkinter is Python's built-in library for creating desktop GUI (Graphical User Interface) applications. It's simple and great for beginners.

How to Install and Import Tkinter?

Tkinter comes pre-installed with Python. You can import it using:

```
import tkinter as tk
```

swipe 

 @plpython

Creating a Basic Window

```
window = tk.Tk()  
window.mainloop()
```

This creates and displays an empty GUI window.

Adding Widgets (Label, Button, Entry)

Widgets are UI elements like text labels, buttons, and input fields:

```
tk.Label(window, text="Hello")  
tk.Button(window, text="Click")  
tk.Entry(window)
```

Understanding the Mainloop

`mainloop()` keeps the window open and listens for user actions like clicks or typing. Without it, the app will close instantly.

Using Geometry Managers (pack, grid, place)

These help you arrange widgets in the window:

- `pack()` – stacks widgets vertically or horizontally
- `grid()` – arranges widgets in rows and columns
- `place()` – sets exact x/y positions

Handling Button Clicks (Command Functions)

You can make buttons do something using the command option:

```
def say_hello():  
    print("Hello!")  
  
tk.Button(window, text="Greet",  
command=say_hello)
```

Basic Styling (Fonts, Colors, Padding)

```
tk.Label(text="Hi", fg="blue", font=("Arial",  
14), padx=10, pady=10)
```

Simple Layout Example

Put everything together:

```
import tkinter as tk

window = tk.Tk()
tk.Label(window, text="Name:").pack()
tk.Entry(window).pack()
tk.Button(window, text="Submit").pack()
window.mainloop()
```

Tkinter Drag and Drop Builder
